

Plotting Lines and Symbols

- `psxy` can be used to plot;
 - lines
 - closed polygons
 - standard geometric symbols (circle, square, etc.)
 - Custom designed symbols
- Polygons and most symbols may be
 - filled with paint of chosen colour
 - filled with B/W or colour pattern

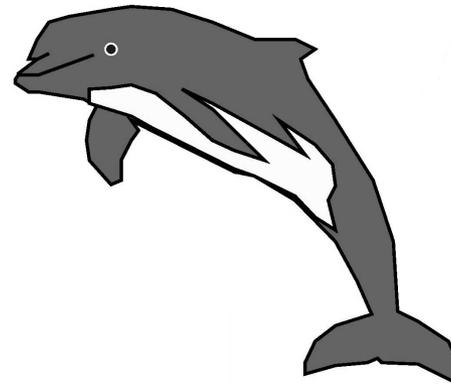

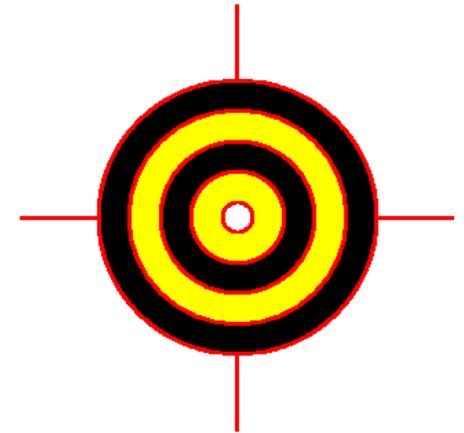

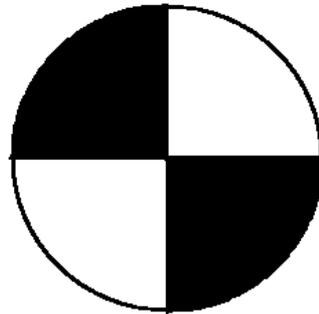

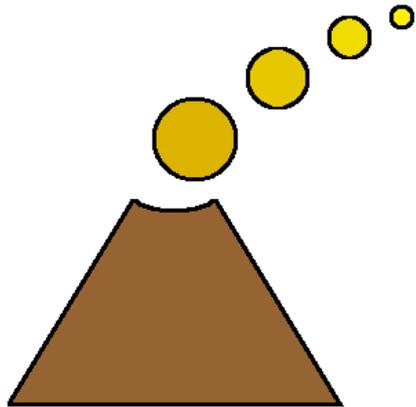

GMT Symbols and Patterns

● Standard Geometrical shapes

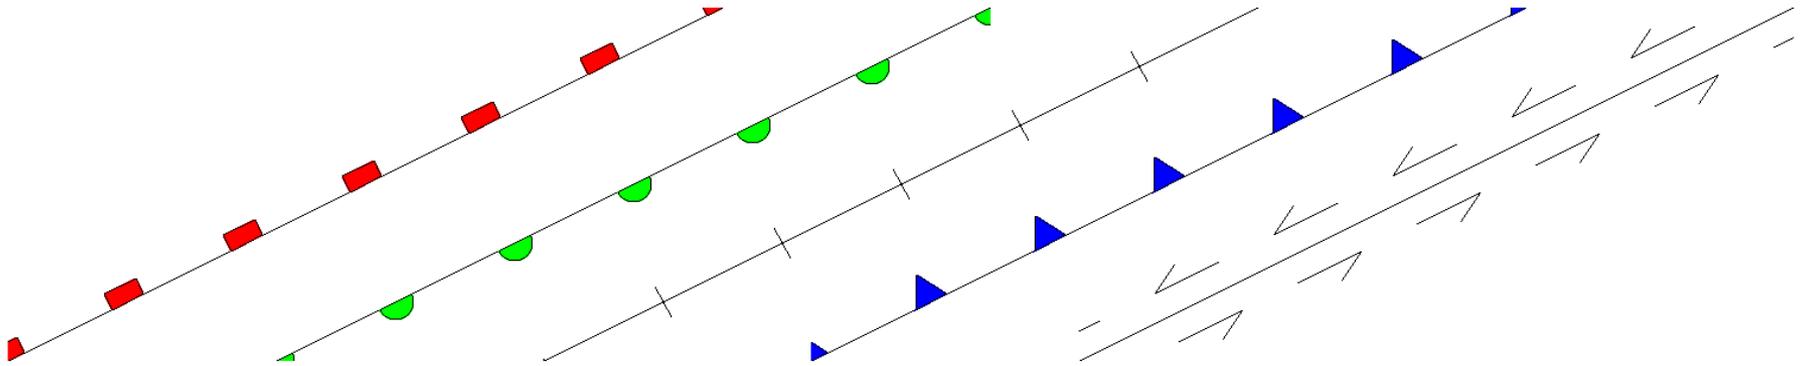

GMT Symbols and Patterns

● User Defined Symbols

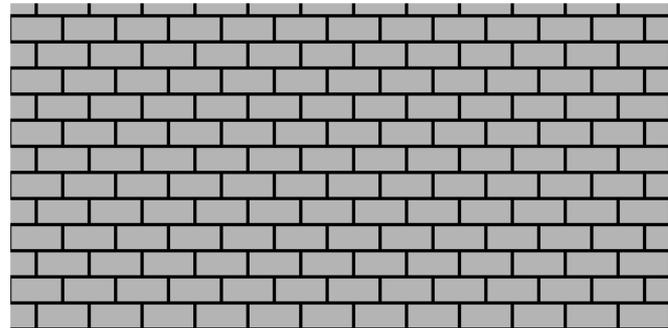

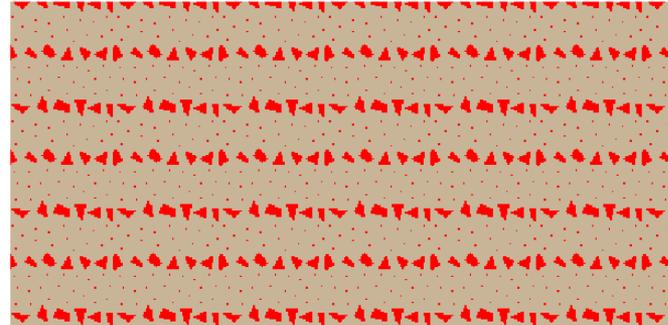

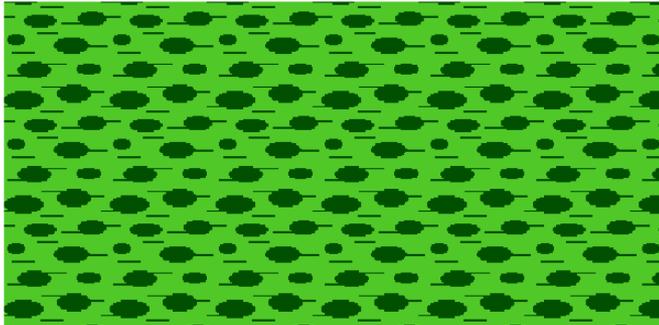

GMT Symbols and Patterns

🌐 Faults, Fronts and other demarcations

🌐 Pattern Fill

Example...

Example...

psxy +
pstext +
psbasemap

Common psxy options

| Option | Purpose |
|---|--|
| -A | Suppress great circle line interpolation |
| -C <i>cpt</i> | Set symbol color from <i>z</i> -values and <i>cpt</i> file |
| -E [<i>x X</i>][<i>y Y</i>][<i>cap</i>][<i>/pen</i>] | Draw error bars with specified attributes |
| -G <i>fill</i> | Set color for symbol or fill for polygons |
| -L | Explicitly close polygons |
| -M [<i>flag</i>] | Multiple segment file; headers start with <i>flag</i> |
| -N | Do Not clip symbols at map borders |
| -S [<i>symbol</i>][<i>size</i>] | Selects one of several symbol |
| -W <i>pen</i> | Set <i>pen</i> for line or symbol outline |

Controlling psxy

● Lines:

- **-Wpen**, optionally **-L** for closure

● Polygons:

- **-Gfill** (implies **-L**)
- Optionally **-Wpen** for polygon outline

● Symbols:

- **-S[symbol][size]**
- If not specified, **symbol** and/or **size** must be given in the data file(s)
- Select **-Gfill** and/or **-Wpen** for outline
- Optionally add error bars with **-E[x|X][y|Y]**

psxy –S: Available symbols

| Code | Symbol | Code | Symbol | Code | Symbol |
|------|------------|------|-------------|------|------------|
| – | x-dash (–) | g | octagon | r | rectangle |
| a | star | h | hexagon | s | square |
| b | bar | i | invtriangle | t | triangle |
| c | circle | k | kustom | v | vector |
| d | diamond | l | letter | w | wedge |
| e | ellipse | n | pentagon | x | cross (x) |
| f | front | p | point | y | y-dash () |

(a, c, d, g, h, i, n, s, t, x) fits inside circle of given diameter

(A, C, D, G, H, I, N, S, T, X) has area equal to circle of given diameter

Specifying colours

- Color names: Give standard X11 names such as red, green, violet, pink, lemonchiffon.
- **RGB** system: Give **r/g/b** where each integer indicates intensity of light from 0 to 255. If $r = g = b$ we have gray and only r needs to be specified.
- E.g. **red** = 255/000/000
- E.g. **yellow** = 255/255/000
- E.g. **pink** = 200/000/080

| PEACHPUFF4 139/119/101 | NAVAJOWHITE1 255/222/173 |

Values are RGB. Names are case-insensitive. Optionally, use GREY instead of GRAY.

psxy exercise 4

🌟 Copy over the file called data.txt

🌟 Use psxy to plot data as transparent circles of size 0.6 cm.

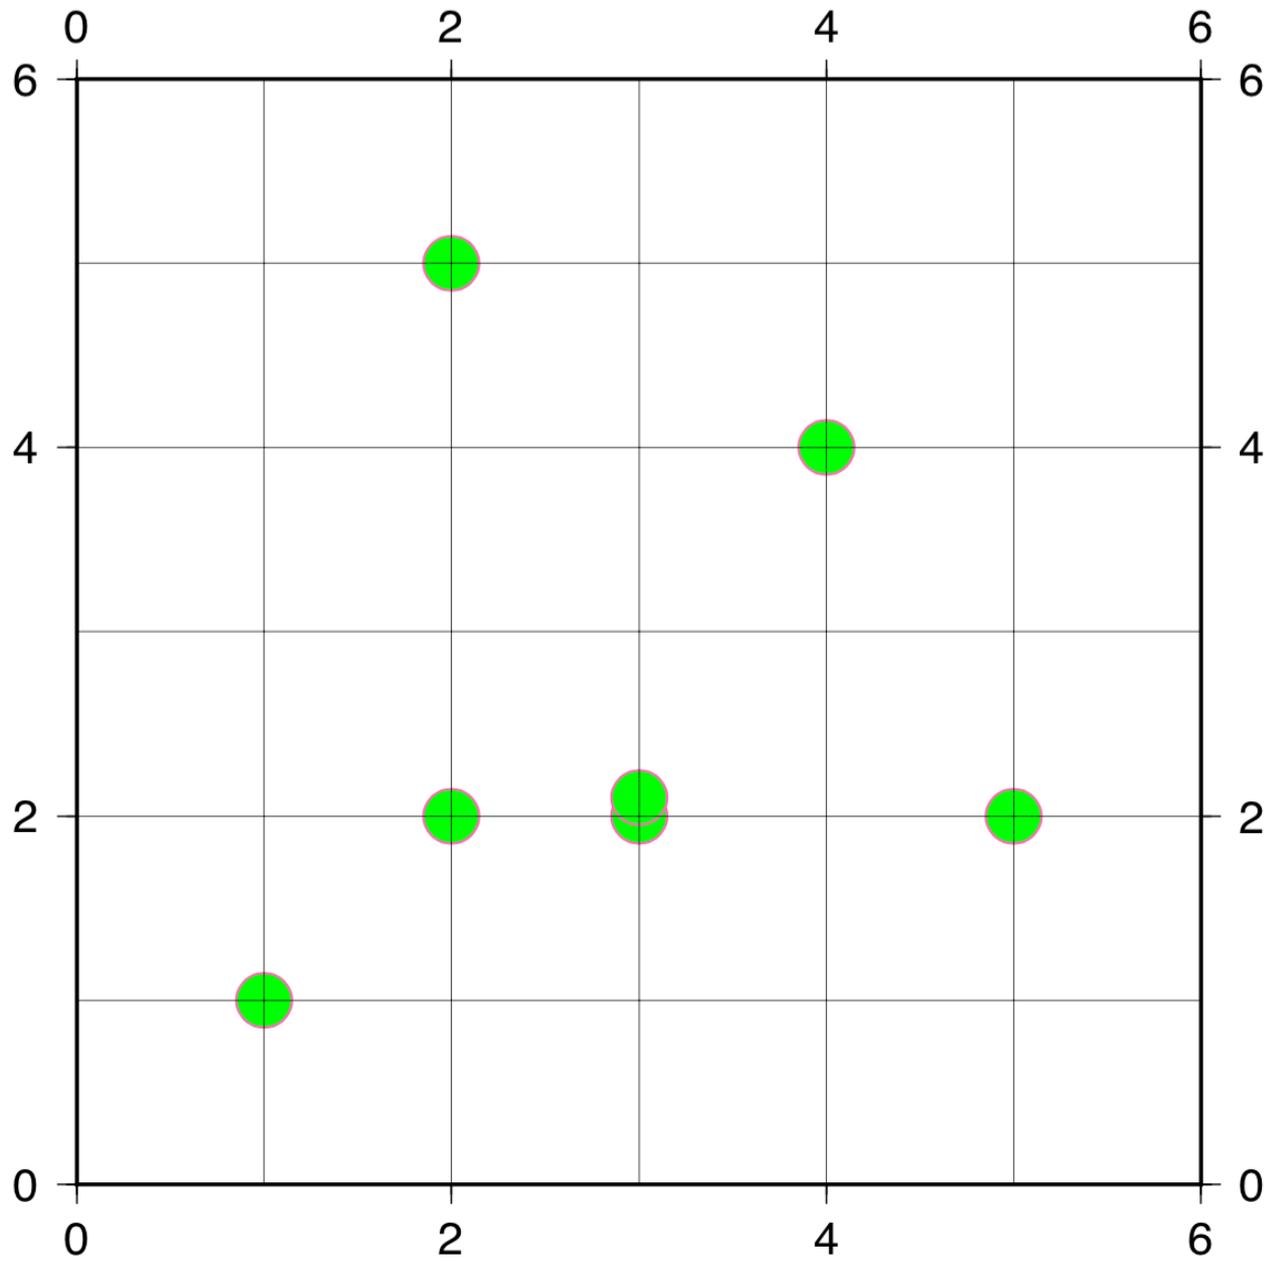

```
psxy data.txt -R0/6/0/6 -JX12 -B2g1 -Sc0.6 -P > ex4a.ps
```

🌟 Try using the -G option to fill the circles (e.g. -Ggreen or -G0/255/0)

```
psxy data.txt -R0/6/0/6 -JX12 -B2g1 -Sc0.6 -P -Ggreen >  
ex4b.ps
```

🌟 Give them back an outline (e.g. -Wthin,hotpink)

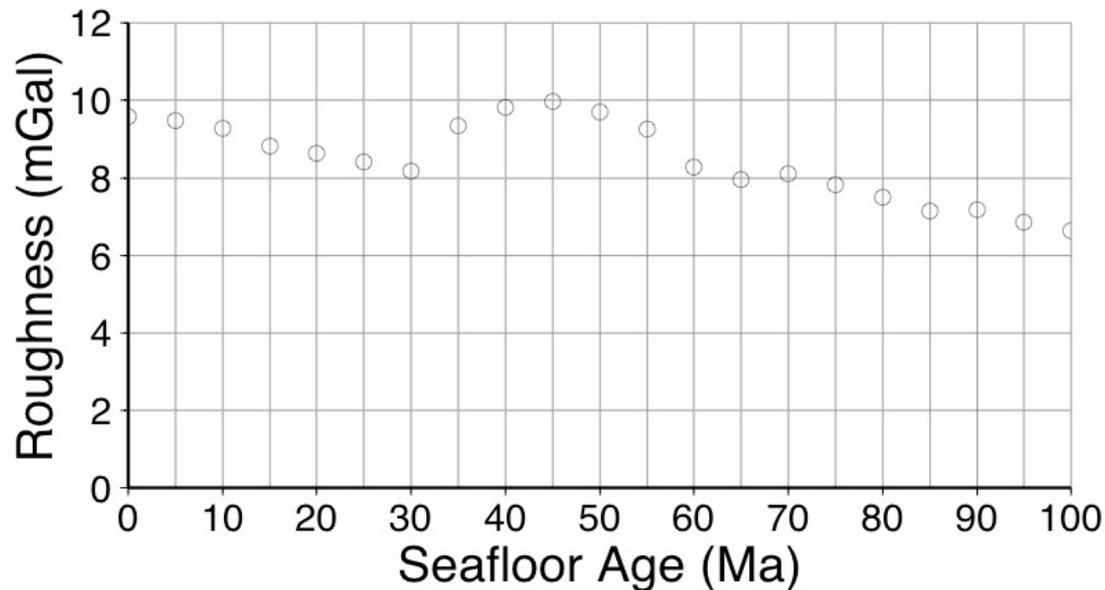

```
psxy data.txt -R0/6/0/6 -JX12 -B2g1 -Sc0.6 -P -Ggreen -  
Wthin,hotpink > ex4c.ps
```

Exercise 5a: Use psxy to plot point data

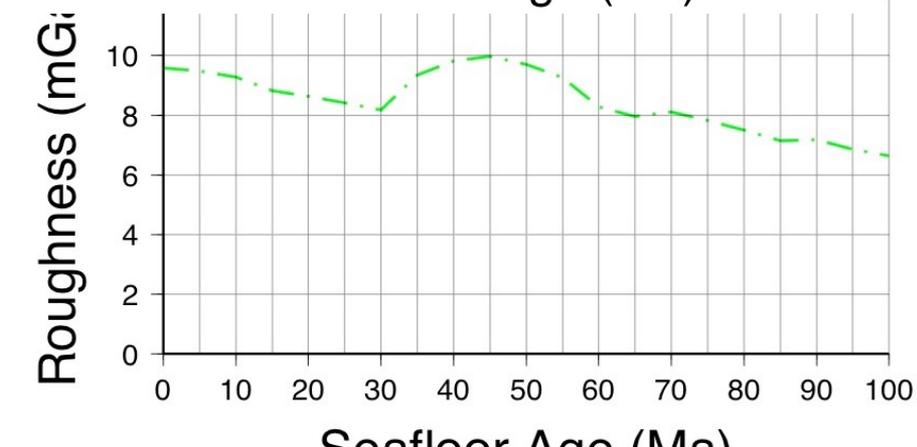

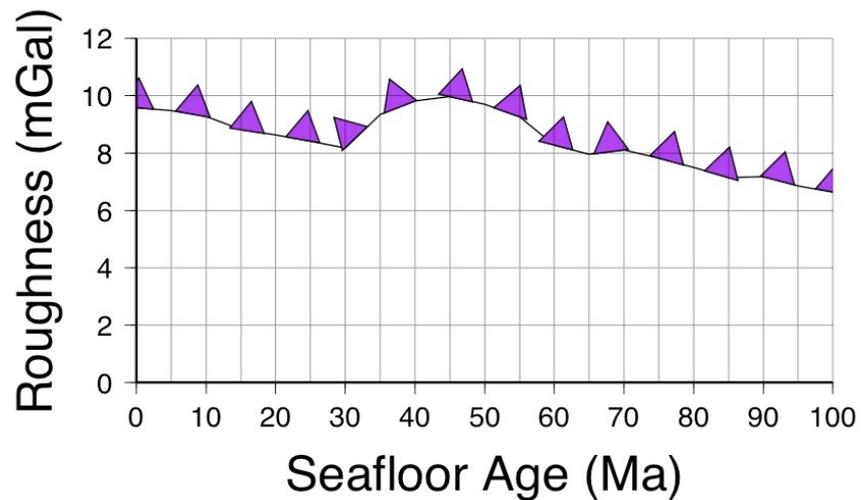

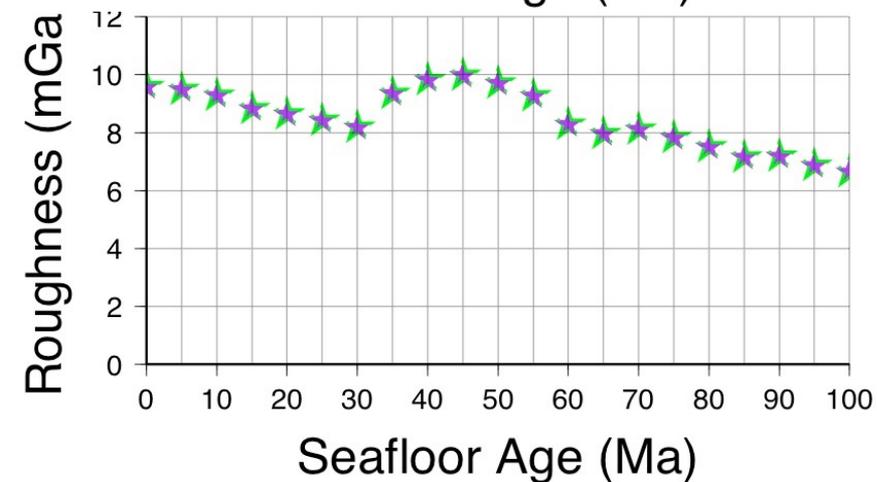

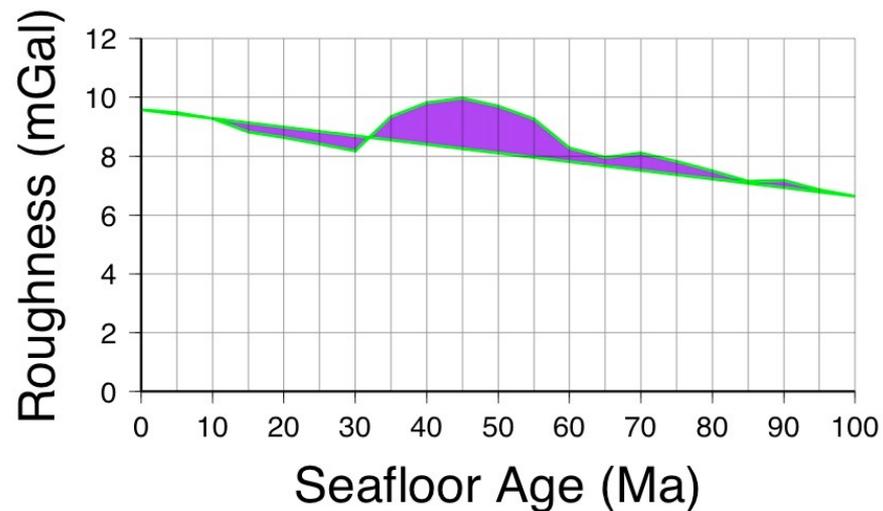

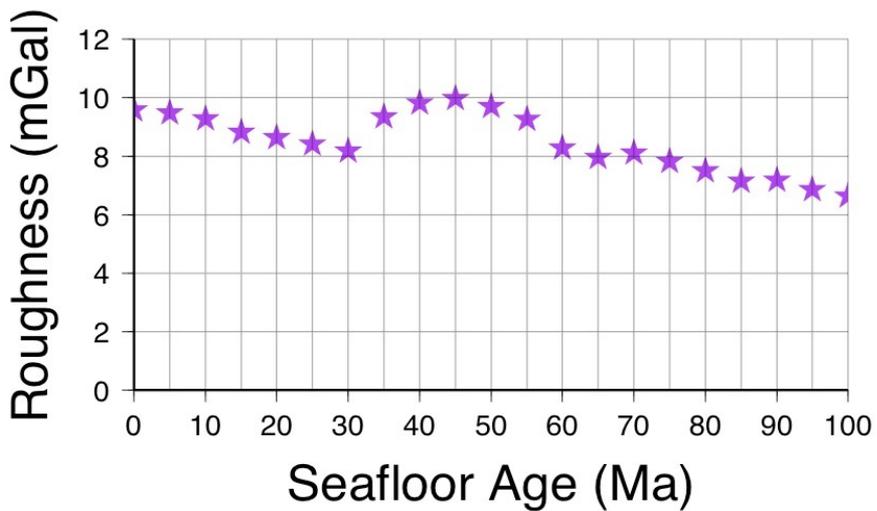

- Copy over the file testpoints.txt
 - Have a look at it using a text editor
 - Use minmax (GMT4) or gmtinfo (GMT5) to determine the range of the data (to fill the ? in the psxy command)
 - Now use the following GMT command and options to plot this data.
- ```
minmax testpoints.txt
```
- ```
psxy testpoints.txt -JX12/6 -R0/?/0/? -Ba10g5:"Seafloor Age (Ma)":/  
a2g2:"Roughness (mGal)":SW -Sc0.2 > testpoints__1.ps
```

- 🔴 -JX12/6 – We are plotting non-geographic data (i.e. these are not latitudes and longitudes) so we need to use -JX. 12/6 sets the width=12cm, and height=6cm.
- 🔴 -R0/100/0/12 – Sets the region of the plot from 0 to 100 for the x-axis and 0 to 12 for the y-axis
- 🔴 -Ba10g5:"Seafloor Age (Ma)":/a2g2:"Roughness (mGal)":SW – For the x-axis, sets the annotation interval to 10 and grid interval to 5. For the y-axis, sets the annotation and grid interval to 2. WS specifies that only the west and south axes of the plot will be plotted and labelled.
- 🔴 -Sc0.2c – This option tells GMT how to treat the data points that are in the file testpoints.txt. 'c' specifies a circle, and 0.2c specifies the size of the circles.

Exercise: Use psxy to plot point data cont...

- Plot as solid purple stars
- Give your stars a thick (1.5p), dashed green outline (-W.....)
- Plot as line data (no symbols)
- Plot as filled polygon using your favorite color (use -L, -W and -G but no -S)
- Plot solid line with inverted triangles (0.6 cm) (hint: look at -Sf

psxy data file format

General format with [optional] columns:

x y [z] [size] [σ_x] [σ_y] [symbol]

- Supply **size** if you want individual sizes*
- Supply error info for **x** and/or **y**:
 - **-EX** needs σ_x (plain error bar)
 - **-EX** needs x_{\min} $x_{25\%}$ $x_{75\%}$ x_{\max} (box-whisker)
- Supply **z** and a cpt file (**-C**) to assign colors based on **z**

***size** is **direction length** for vectors, **direction major- minor-axis** for ellipses, and **width height** for rectangles

psxy exercise 6 – Specifying errors etc in the input file

- 1) Use the file `testpoints_sizes.txt` to plot different symbols for different points. (Hint: remove symbol from the command line e.g. `-S0.5` rather than `-Sa0.5` as the symbol is defined in the input file)
- 4) Use the file `testpoints_errors.txt` and the `-E` option with `||` to plot error bars to the y-axis

Plotting basic maps with `pscoast`

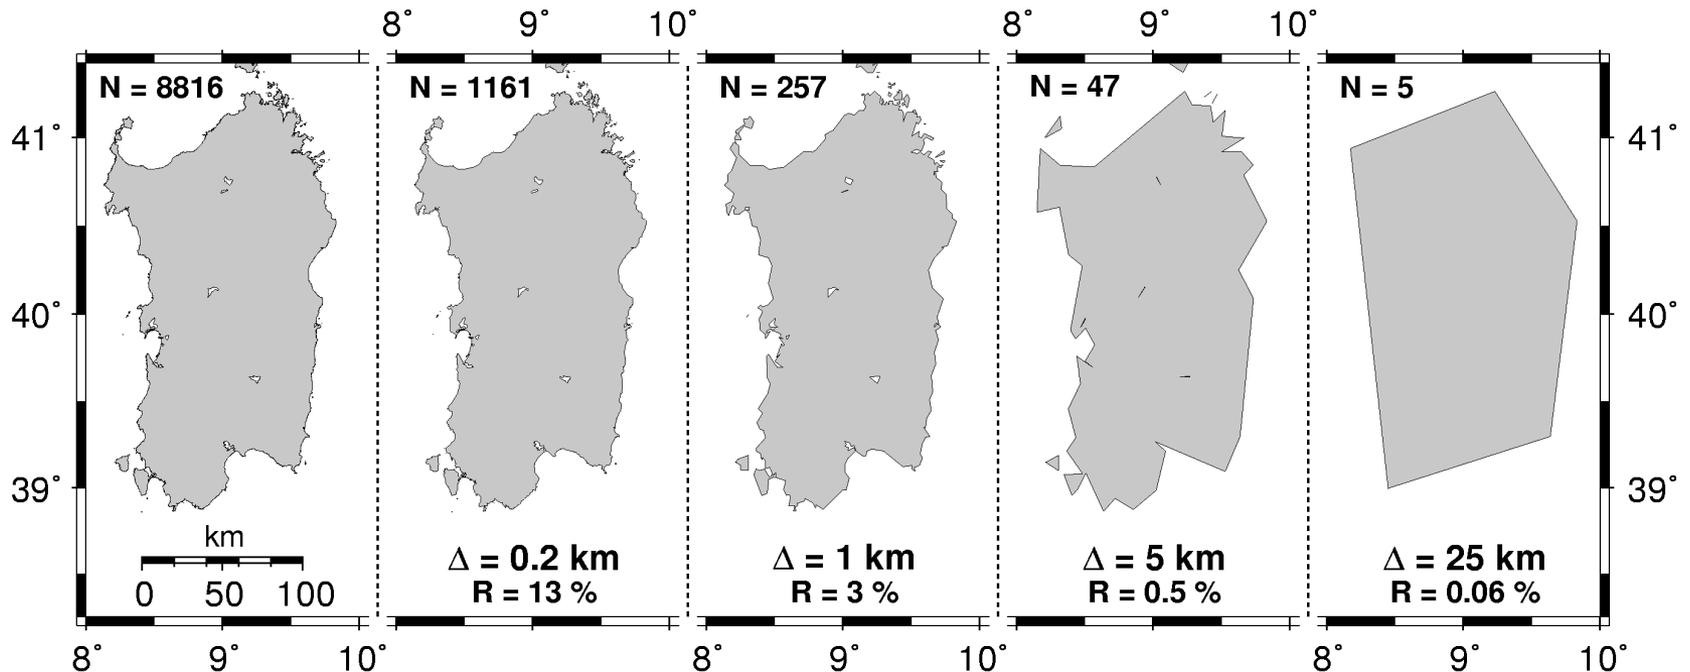

- Takes `-R`, `-J`, and `-B` for basic setup
- One or more additional options required:

| Option | Purpose |
|-----------------|--|
| <code>-A</code> | Exclude small features or those of high hierarchical levels |
| <code>-D</code> | Select data resolution (<code>full</code> , <code>high</code> , <code>intermediate</code> , <code>low</code> , <code>crude</code>) |
| <code>-G</code> | Color of dry areas [no paint] |
| <code>-I</code> | Draw rivers (append category and pen) |
| <code>-L</code> | Plot map scale |
| <code>-N</code> | Draw political boundaries (append category and pen) |
| <code>-S</code> | Color of wet areas [no paint] |
| <code>-W</code> | Draw coastline (append pen) |

The 5 Coastline Resolutions

🌐 full, high, intermediate, low [Default],
crude

🌐 About 20% reduction in detail per level

Exercise 7a: pscoast

Make a Mercator map of Australia. Plot green land with blue oceans.

- Try another coastline resolution
- Draw the coastline with a white pen
- Change annotation appearance with
PLOT_DEGREE_FORMAT/FORMAT_GEO_MAP
- `pscoast -R110E/160E/45S/5S -JM12 -Ba10g5/a10 -Glightbrown -Slightblue -Dh -Wthin,white > Australia.ps`

UTM Projection

- Conformal and Cylindrical projection

- Syntax: `-Jzone/width` or `-Jzone/scale`

- Height calculated automatically

- Zone is a 6° wide longitude strip starting at 180°W

- E.g., zone 1 is 180°W to 174°W, centered on 177°W

- zone is usually provided, if not, compute from the central meridian as

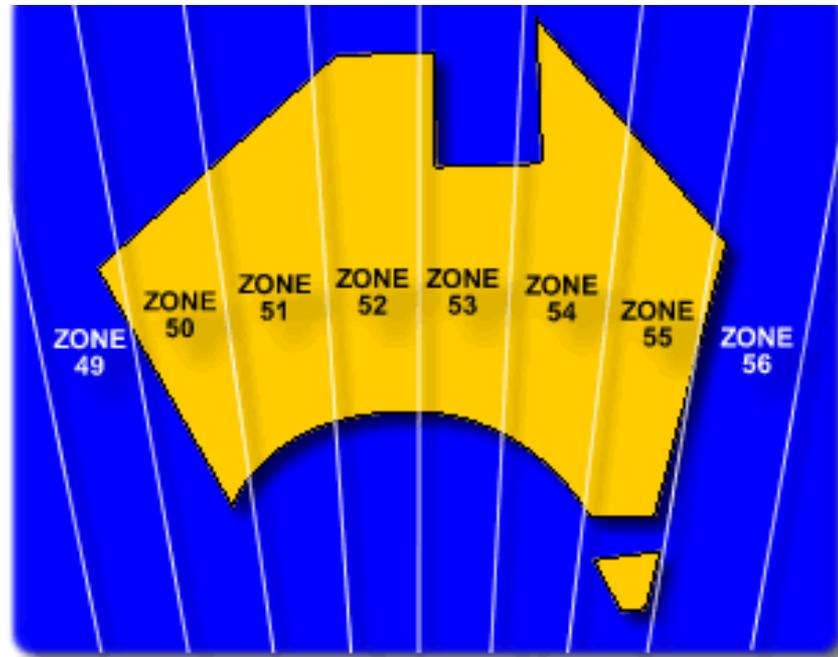

$$? \text{ zone} = ((lon + 180)/6) / 60 + 1 \quad \text{zone} = \frac{(lon - 180 + 360) \% 360}{6} + 1$$

- Some special zones are different (see map)

- scale can be

- plot units per degree or 1:xxxxxxx

UTM Zones - Australia

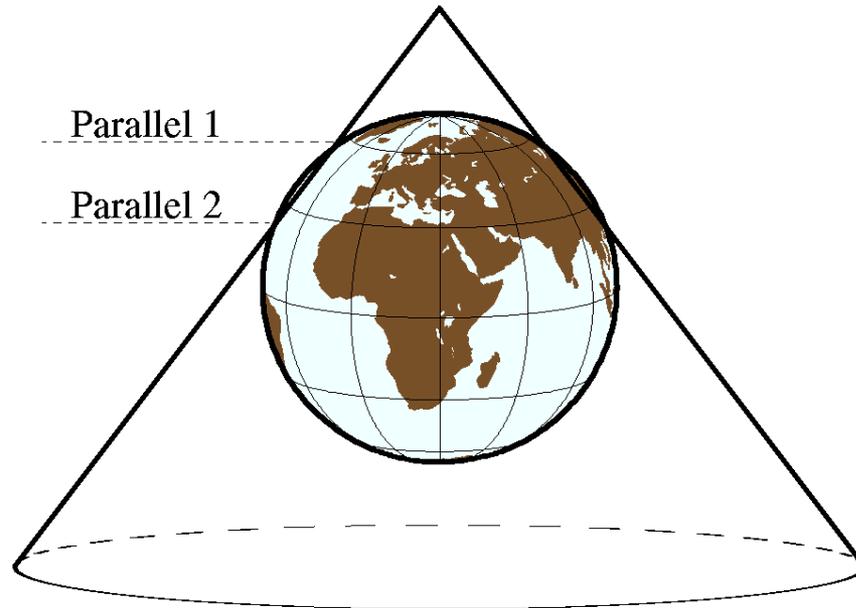

Exercise 8: UTM Afghanistan

- 🌐 Task: Make a UTM map of Afghanistan, using UTM zone 40. Plot shaded land with political borders.
- 🌐 Use lower left and upper right setup instead of w/e/s/n

Conical Projections

- Cone defined by **two standard parallels**
- Cone unrolled to yield flat sheet
- Conformal, equal area, or equal distance

Conical Map Projections

🌐 Syntax:

🌐 **-J** Δ lon₀/lat₀/slat₁/slat₂/width

🌐 **-J** δ lon₀/lat₀/slat₁/slat₂/scale

🌐 **scale** can be

🌐 plot units per degree

🌐 1:xxxxxx

🌐 Conical Map Projections include;

🌐 **B** (or **b**): Albers Equal-Area

🌐 **D** (or **d**): Equidistant

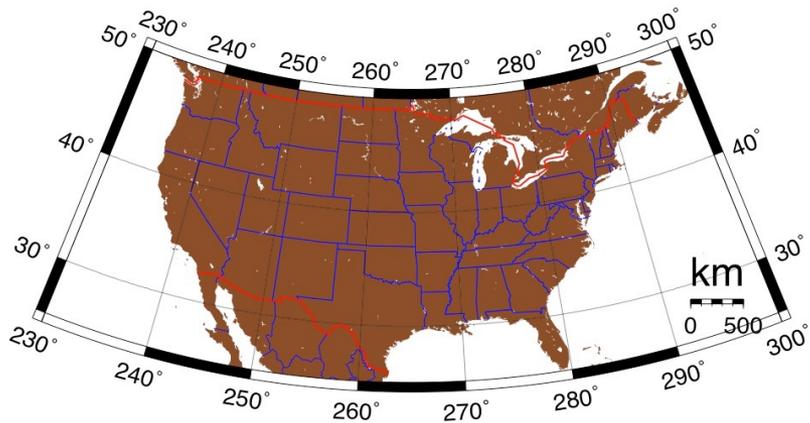

🌐 **L** (or **a**): Lambert Conformal

Exercise 9: Conical Map of the US

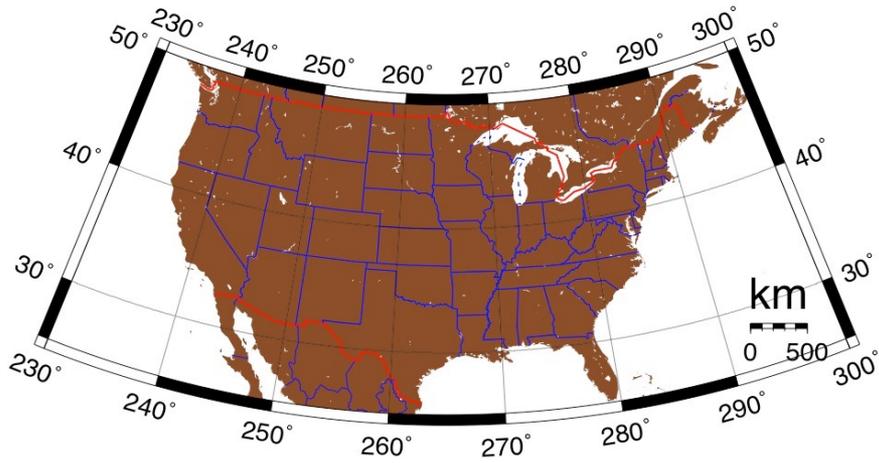

- Make a map of continental US, with 33N and 45N as parallels. Paint land, and draw national and state borders
- `pscoast -R230/300/25/50 -JB265/35/33/45/10 -B10g10 -Gdarkbrown -Lf295/28/33/500k -P > conical_us.ps`

Exercise 9: Conical Map of the US

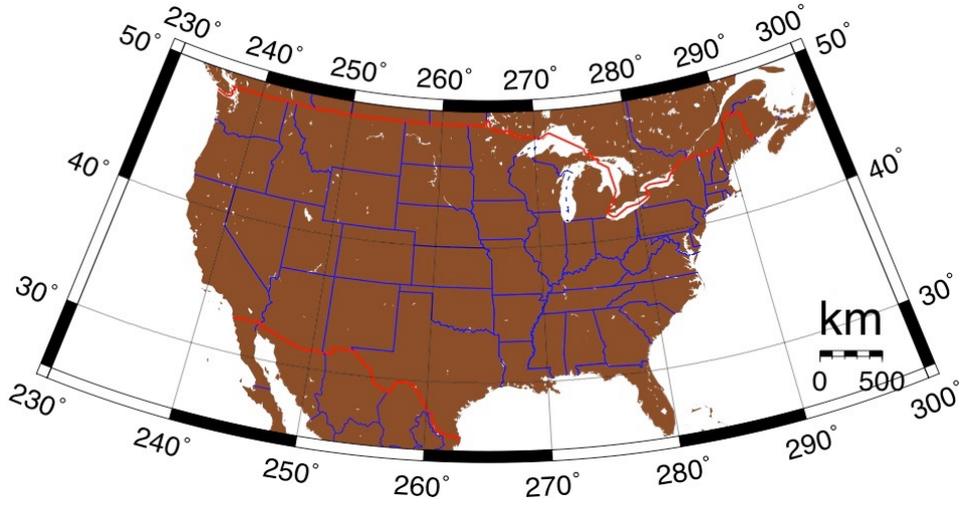

- Make a map of continental US, with 33N and 45N as parallels. Paint land, and draw national and state borders
- Draw grid crosses every 10 degrees
- Use rectangular region
- Add map scale with `-L`
- Now plot 3 maps which will show each of the 3 conic projections in GMT, applied to the continental US (complete with political borders and scale)

Albers

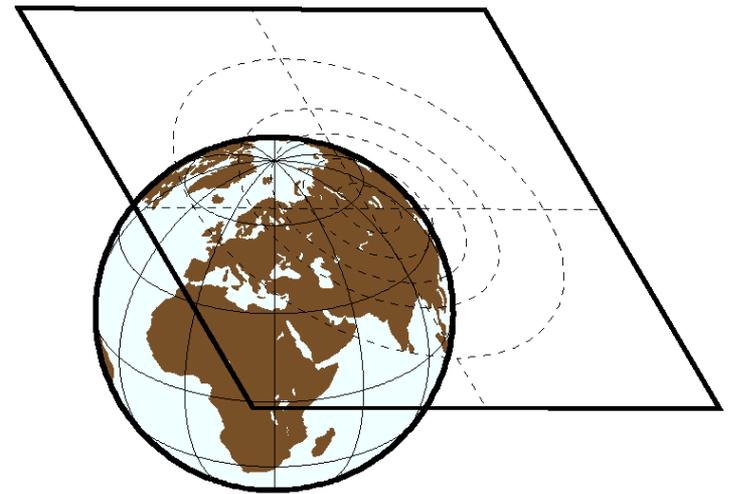

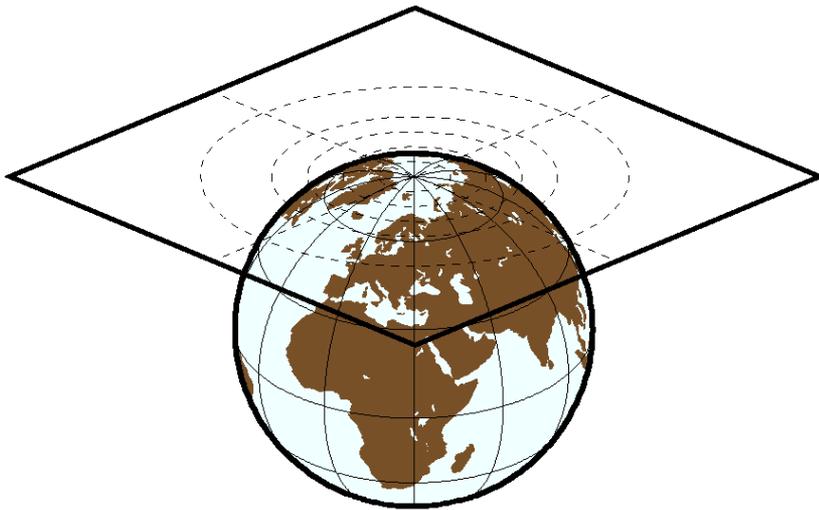

Equidistant

Lambert

Azimuthal projections

- Plane is tangent to point of origin
- Coordinates projected onto plane
- Conformal, equal area, equal distance, other

Azimuthal Map Projections

🌐 Syntax:

🌐 **-J** Δ lon₀/lat₀/width

🌐 **-J** δ lon₀/lat₀/scale

🌐 **scale** can be

🌐 plot units per degree

🌐 1:xxxxx

🌐 lat_s/1:xxxxx

🌐 radius/lat

🌐 Azimuthal Map Projections include;

🌐 **A** (or **a**): Lambert Equal-Area

🌐 **E** (or **e**): Equidistant

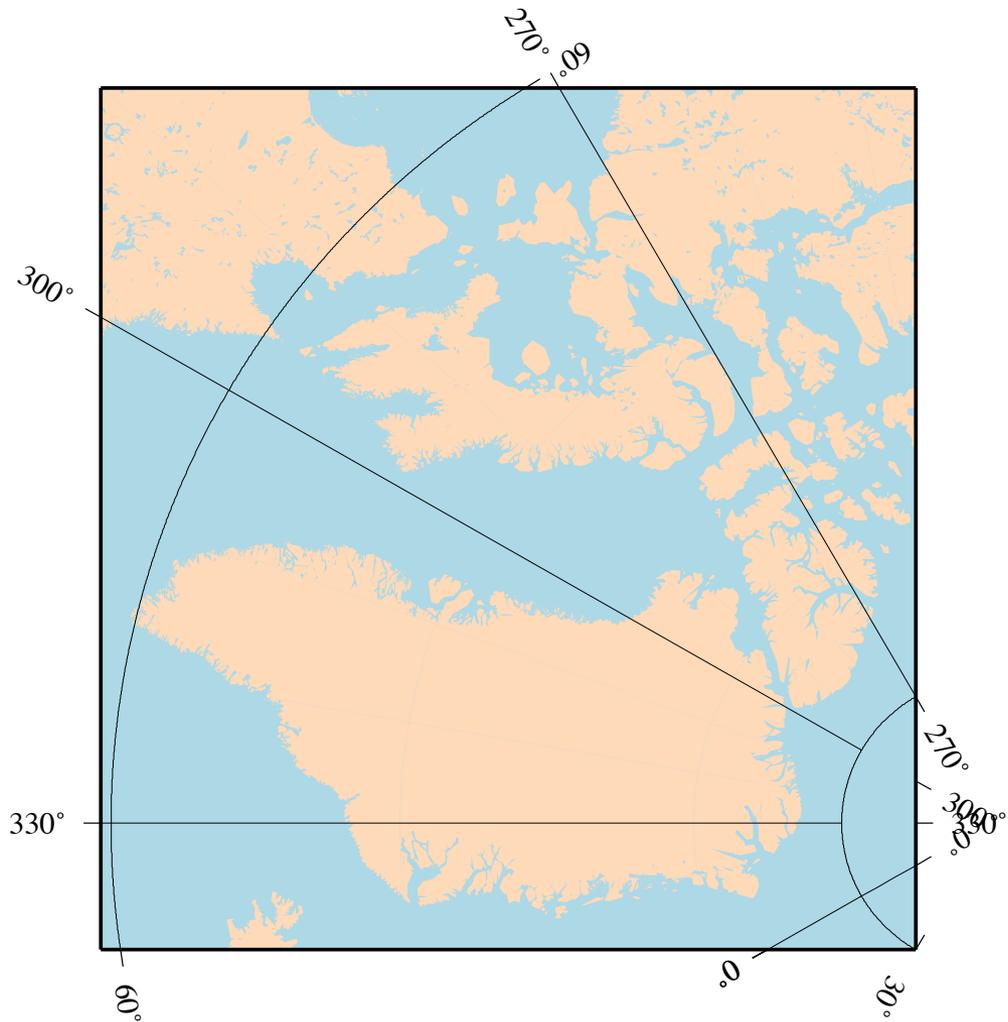

🌐 **G** (or **g**): Orthographic

🌐 **S** (or **s**): Stereographic Conformal

🌐 **F** (or **f**): Gnomonic (takes lat_h/scale)

Exercise 10: Azimuthal Greenland – Equal–Area and Orthographic

- Task: Plot two maps on separate pages:
 - 1) Showing Baffin Island and Greenland using an equal–area azimuthal projection with rectangular borders
 - 2) Showing global setting of Greenland and Baffin Island using an orthographic view

Answers

- pscoast -R70W/50N/30E/85Nr -JA30W/
90N/10 -Gpeachpuff -Slightblue -B30g30 -P
> greenland1.ps
- pscoast -Rg -JG20W/50/4 -Gpeachpuff -
Slightblue -P -B30g30 > greenland2.ps

Thematic (Global) Map Projections

● Most have the syntax:

● $-\mathbf{J}\Delta\text{lon}_0/\text{width}$

● $-\mathbf{J}\delta\text{lon}_0/\text{scale}$

● **scale** can be

● plot units per degree

● 1:xxxxxx

● Thematic Map Projections include;

● **H** (or **h**): Hammer [E]

● **R** (or **r**): Robinson (National Geographic Society)

● **I** (or **i**): Sinusoidal [E]

Exercise: Hammer, Robinson and Sinusoidal

- Task: Plot 3 global maps centered on the Americas
 - Use Hammer, Robinson, and Sinusoidal
 - You choose colors and pens
 - Use crude coastlines and -A10000
